C; therefore  $C = 0$ ; in order then that the integral may express the space estimated from the point A, the constant C must be zero; that is, we have no constant to add, and we have, generally, the in 1 3 definite space  $APM = \int p x$ . But if we wished to estimate the space from the point K, such that  $AKz = b$ , (b being a known quantity); we should have  $KPLM = \int p 2 J + C$ -, now this space KPLM becomes zero, when AP or  $x = b$ ; we i-? have therefore, in that case,  $0 = \int p 6 Y + C$ ; therefore and consequently  $KPLM = \int p x - f i$ . We thus see what purpose is served by the constant, which is added...
